

Q&A; History

Question 1: File Oriented approach

Answer 1: The provided text describes the file-oriented approach to information processing as a traditional method where each application has a separate master file and its own set of personal files. The program is dependent on the files, and the files are dependent on the programs. The disadvantages of this approach include data redundancy and inconsistency, difficulty in accessing data, data isolation, integrity problems, atomicity issues, concurrent access problems, and security problems.

Question 2: computational physics

Answer 2: This document does not contain the answer to this question. The provided text focuses on relational database design and theory.
